Allowable Subject Matter

Claims 1 – 18 are allowed. The prior art of record fail to teach controlling engagement of a clutch which carries torque before, during and after a shifting event in a transmission which is connected to a throttle-controlled engine, comprising, among other limitations, providing a feed-forward input command which increases as the engine torque increases, and decreases as the engine torque decreases; providing a feedback input command which is a function of an error value equaling a calculated difference between measured clutch slip and a reference slip profile, wherein said reference slip profile includes: a driving portion in which a first low slip amount is maintained; a pre-shift portion in which slip is increased from said first low slip amount to a medium slip amount when approaching a vehicle shift speed; a during-shift portion in which slip increases from said medium slip amount to a peak slip amount and then decreases to a second low slip amount; and a post-shift portion in which the second low slip amount is maintained; and summing said feed-forward input command and said feedback input command to provide a clutch control command for controlling engagement of the clutch before, during and after the shifting event to allow a desired amount of clutch slip to damp excitation of the transmission.
